

Introduce yourself

Hello, Thank you so much for providing me this opportunity, My name is Namrata Subhash Harshe, I have completed my graduation in Computer Science engineering in 2021 from Maharashtra Institute of Technology, Aurangabad with Distinction, I was always fascinated towards programming and emerging technologies and couple of my family members also graduate from computer science and have successful career now so I choose this field to study. I have made few mini projects and a major project in my engineering. My Major project was "Car Number Plate Recognition". It was a group activity we were 3 members in my project where my role was to detect the number plate from input image, during project I found that there are various aspects apart from academics like team work, having proper strategy, good knowledge of various languages so I started learning Python, SQL using various online resources. I also participated every event in my college. I tried and trying myself to be technically fit and good team player.

This is on high level about myself, if you have any specific questions, I am open to that.

Why you choose this course?

I was always fascinated towards programming and emerging technologies and I have also done a major project using python and machine learning algorithm, During project I found machine learning interesting and wanted to learn more from basics and build my career in this field. I searched online and asked my friends about data science courses, from one of my friend I came to know about Edyoda digital university and data science course offered by them so I gone through all the details like curriculum of course, fee details etc. I found it perfect for me to start with so, I chose this course.
